## 2 Troubleshooting

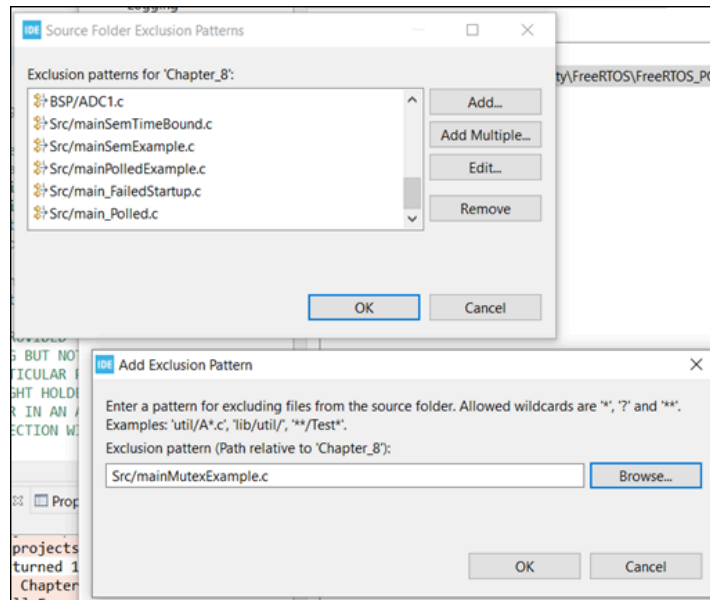

## 2.1 Build proble

## 2.2 How to enab

## 2.3 How to run '

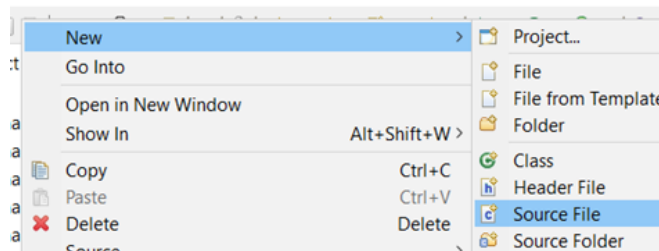

## 2.4 Build's clean

- o Click on "Apply and close" to save

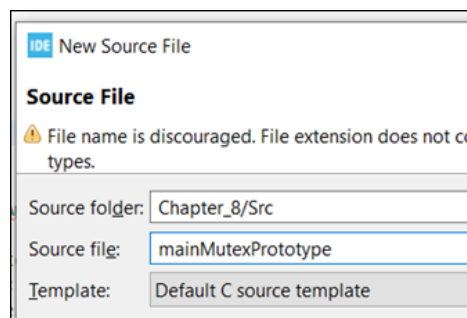

## 1.2.3 For the new configuration, add a new C-file

- Next, add a new C-file to the Src folder, for the new configuration
  - o Click on File:New:Source File

- In the GUI "Source File"
  - o Set the entry "Source folder" to the chapter-folder and its "Src" folder
  - o Set the entry "Source file" to a name for the new-configuration's C-file
    - The file-name needs the ".c" extension, which isn't shown below, mistakenly

## 1.2.4 Update the other configurations

- For the chapter's project, a new configuration was added. The other configuration are the "older-configurations".
- Update the older-configurations to exclude the new C-file. Each older-configuration has to be updated separately. Use an Exclusion Pattern, as shown earlier. This is very time-consuming, and there may be a better way to handle this.

## 1.3 How to create a new project
